

## **Challenge Faced**

One of the biggest challenges I faced while doing this practical was dealing with too many commands, and a lot of them were quite long too. Right from starting the Hadoop services, uploading the dataset to HDFS, running the mapper and reducer script, and then checking the output, there was a command for almost every single step. Some of these commands, like the one for running the streaming job, were really long with a lot of file paths and options in them.

I overcome this by testing the mapper and reducer separately on my own system before running them on Hadoop, and I also direct copy paste the commands so I reuse them instead of typing everything again. This made things a lot easier and helped me avoid repeating the same mistakes.
